

## Pretalc B 70

High value talc-masterbatch for mixing into diverse plastics polymers during injection moulding or extrusion processes.

**Pretalc B70** is a highly concentrated talc-masterbatch (70 % loaded) and adds very costefficiently high-value, highly reinforcing and very bright talc in plastic applications. It is especially reinforcing polypropylene homopolymers, but is dosed into polyamides as well. This masterbatch brings flexibility for creating specific formulations.

<b>CARRIER POLYMER</b>	LDPE
<b>FILLER CONTENT</b>	70 %
<b>PHYSICAL PROPERTIES</b>	density 1650 kg/m <sup>3</sup> Bulk density ca. 1200 kg/m <sup>3</sup>
<b>PACKAGING</b>	in 25 kg bags (1250 kg per pallet) or in octabins containing 1250 kg

These data are typical values of that product, should not be seen as obligatory
